

Supplement to Longitudinal analysis of
early childhood stunting in low-resource
settings

Jade Benjamin-Chung et al.

2019-12-18

Contents

1	Overview	5
2	Relative risk plots	7
3	Growth velocity	9
4	Sensitivity analysis using fixed effects	11
4.1	Primary manuscript figures recreated with estimates pooled using fixed effects	11
5	Unadjusted RF plots	23
6	Sensitivity analysis of spline-fitting method	25
6.1	WLZ, stratified by maternal weight	25
6.2	WLZ, stratified by maternal height	28
6.3	LAZ, stratified by maternal weight	31
6.4	LAZ, stratified by maternal height	33
6.5	WLZ, stratified by maternal BMI	36
6.6	LAZ, stratified by maternal BMI	40
7	Dropping PROBIT Trial	43
8	Heatmaps	45
8.1	Heatmap of significance of estimates, region stratified	46
8.2	Heatmap of significance of estimates pooled using fixed effects . .	48
8.3	Heatmap of significance of estimate, unadjusted	50

9	KI Kaplan-Meier Survival Curves	51
9.1	Associations between early growth failure and mortality	52
9.2	Associations between any growth failure and mortality	55
9.3	Kaplan-Meier curves	57
10	Forest plots of relative risk	63

Chapter 1

Overview

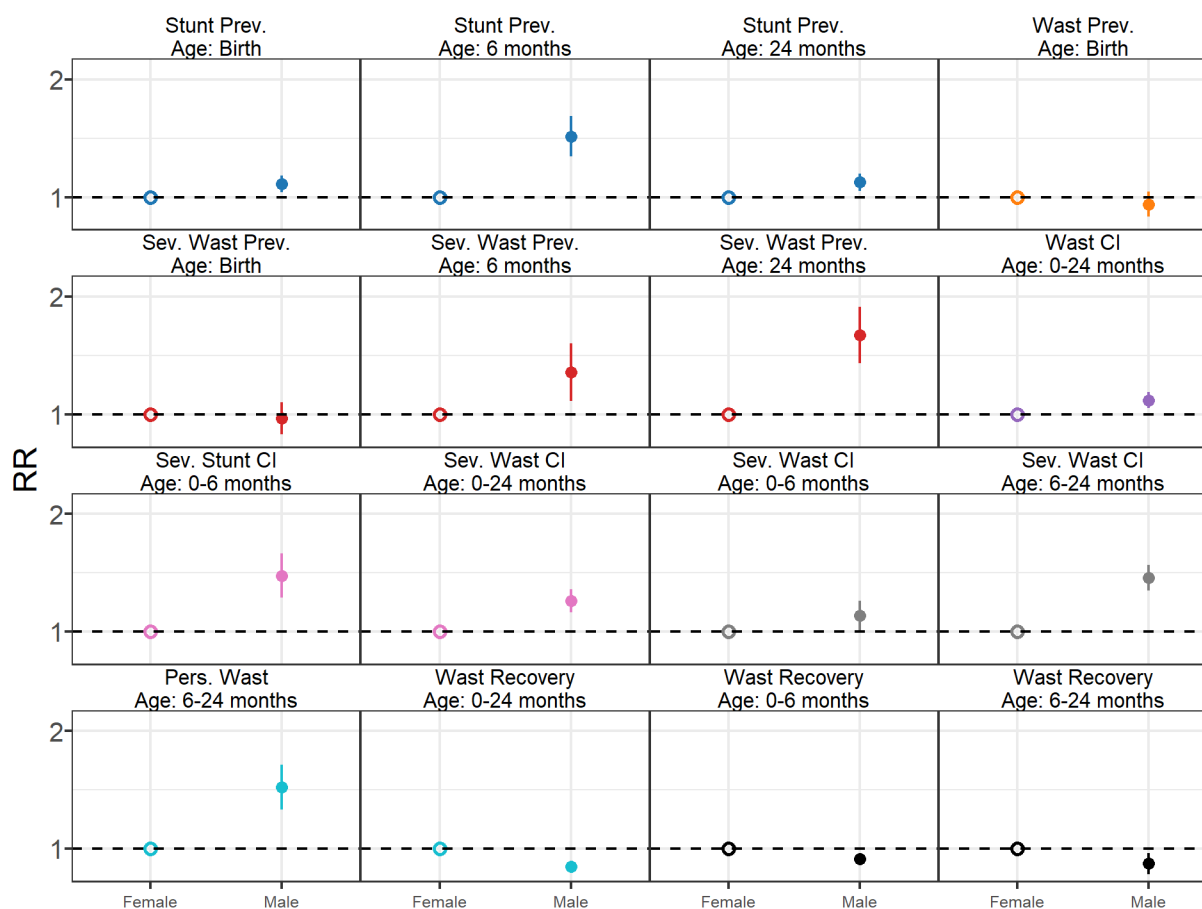

Recommended citation: Benjamin-Chung J, et al. 2020. Longitudinal analyses of early childhood stunting in low-resource settings. *Journal Name*. doi.

This site contains supplementary information to the *Longitudinal analyses of early childhood stunting in low-resource settings*.

Chapter 2

Relative risk plots

2.0.1 Relative risks between levels of all exposures for prevalence and cumulative incidence of wasting and stunting outcomes

Chapter 3

Growth velocity

** [TEMP] Will fill in with PAR plots of growth velocity **

Chapter 4

Sensitivity analysis using fixed effects

The primary analyses presented in this manuscript pooled across individual studies using random effects. Inferences about estimates from fixed effects models are restricted to only the included studies.^[1] The random effects approach was more conservative in the presence of study heterogeneity, as evidenced by larger confidence intervals around each point estimates. Overall, the inference from results produced by each method was similar.

4.1 Primary manuscript figures recreated with estimates pooled using fixed effects

More estimates are significant when pooling using fixed effects due to the generally smaller confidence intervals.

4.1. PRIMARY MANUSCRIPT FIGURES RECREATED WITH ESTIMATES POOLED USING FIXED EFFECTS

Figure 1a. Heatmap of significance and direction across exposure-outcome combinations of associations estimated using fixed effects.

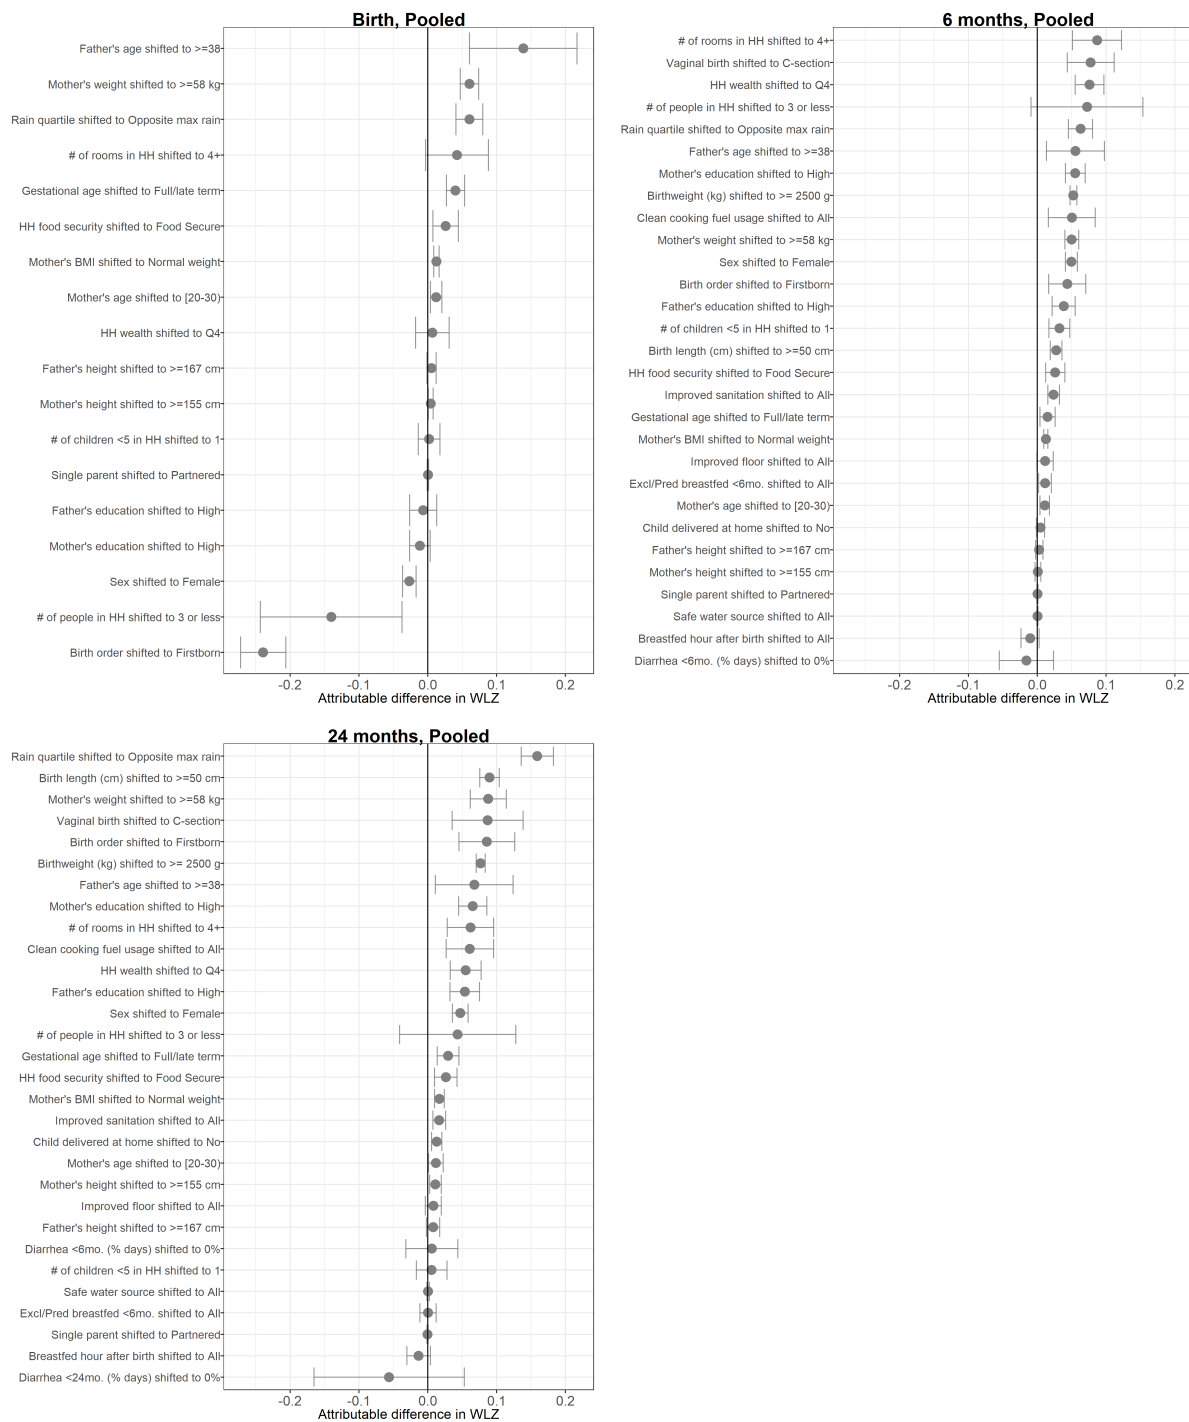

Attributable difference - LAZ, stratified by age

4.1. PRIMARY MANUSCRIPT FIGURES RECREATED WITH ESTIMATES POOLED USING FIXED EFFECTS

Extended Data Figure 3 | Age-stratified population attributable differences in length-for-age Z-scores estimated using fixed effects.

Attributable difference - WLZ, stratified by age

4.1. PRIMARY MANUSCRIPT FIGURES RECREATED WITH ESTIMATES POOLED USING FIXED EFFECTS

Extended Data Figure 4 | Age-stratified population attributable differences in weight-for-length Z-scores estimated using fixed effects.

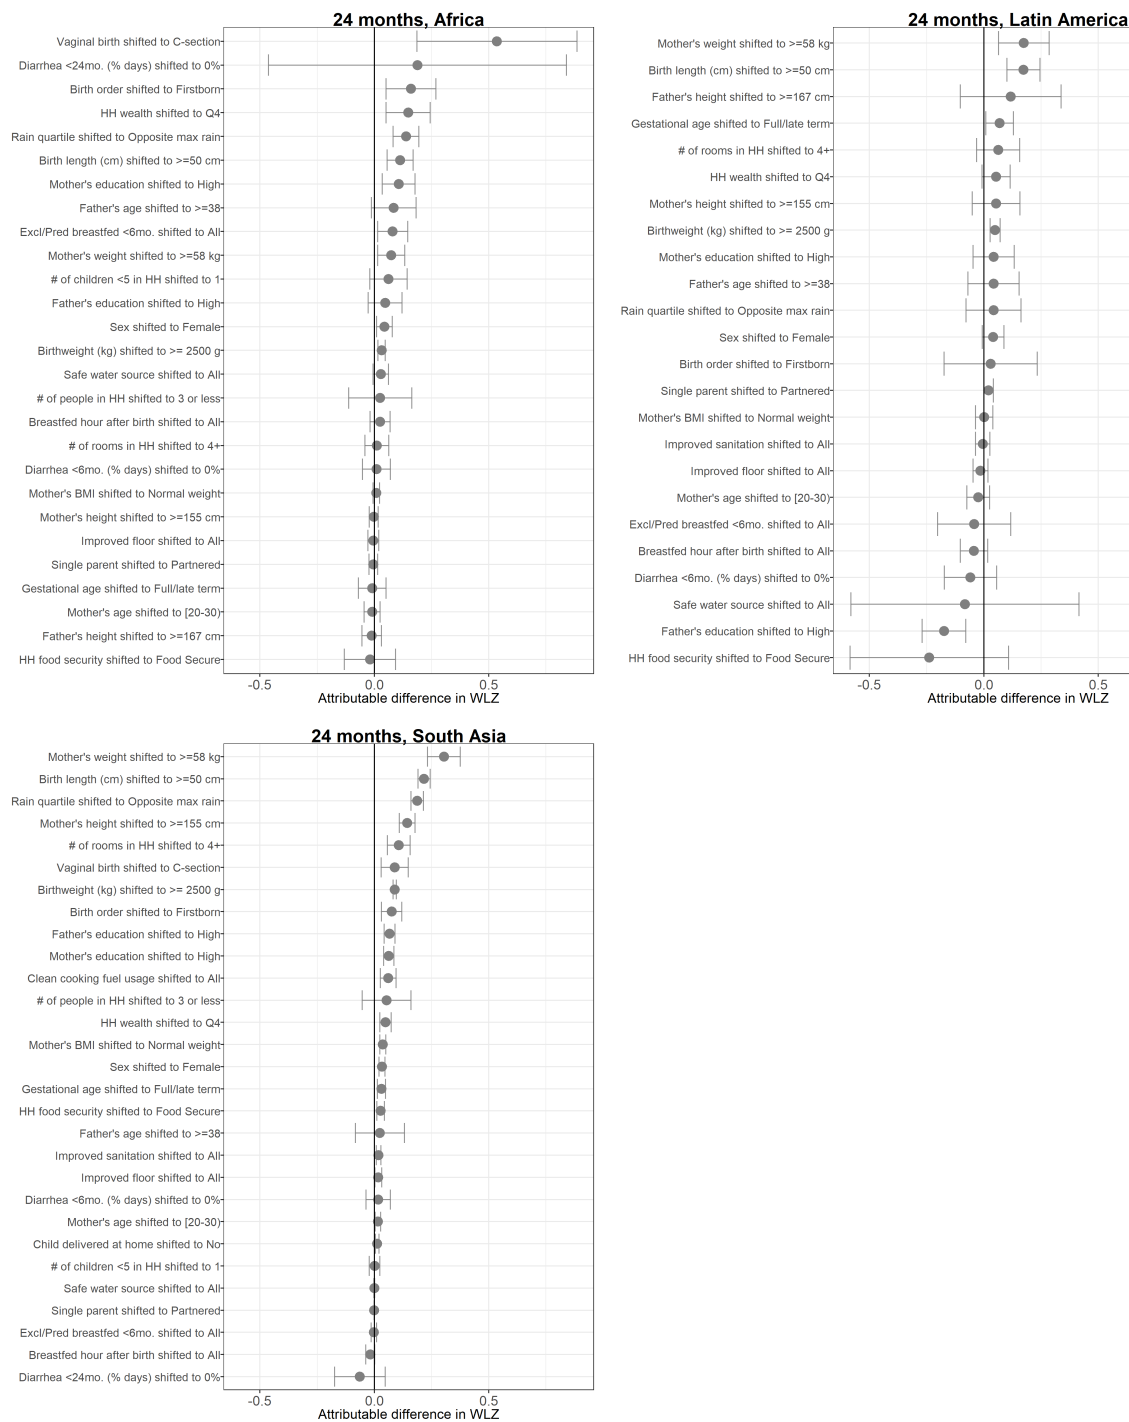

Attributable difference - LAZ, stratified by region

4.1. PRIMARY MANUSCRIPT FIGURES RECREATED WITH ESTIMATES POOLED USING FIXED EFFECTS

Extended Data Figure 7 | Region-stratified population attributable differences in length-for-age Z-scores estimated using fixed effects.

Attributable difference - WLZ, stratified by region

4.1. PRIMARY MANUSCRIPT FIGURES RECREATED WITH ESTIMATES POOLED USING FIXED EFFECTS

Extended Data Figure 8 | Region-stratified population attributable differences in weight-for-length Z-scores estimated using fixed effects.

Chapter 5

Unadjusted RF plots

** [TEMP] Will fill in with all primary plots, unadjusted **

Chapter 6

Sensitivity analysis of spline-fitting method

6.1 WLZ, stratified by maternal weight

6.1.0.1 Primary plots

6.1.0.2 Splines fit to all data, naive to study membership

6.1.0.3 Splines fit to random-effect pooled monthly means

6.1.0.4 Random-effects meta-analysis of splines, sensitivity to parameters

6.2 WLZ, stratified by maternal height

6.2.0.1 Primary plots

6.2.0.2 Splines fit to all data, naive to study membership

6.2.0.3 Splines fit to random-effect pooled monthly means

6.2.0.4 Random-effects meta-analysis of splines, sensitivity to parameters

6.3 LAZ, stratified by maternal weight

6.3.0.1 Primary plots

6.3.0.2 Splines fit to all data, naive to study membership

6.3.0.3 Splines fit to random-effect pooled monthly means

6.3.0.4 Random-effects meta-analysis of splines, sensitivity to parameters

6.4 LAZ, stratified by maternal height

6.4.0.1 Primary plots

```
## Warning: Removed 1711 rows containing missing values (geom_path).
```

6.4.0.2 Splines fit to all data, naive to study membership

6.4.0.3 Splines fit to random-effect pooled monthly means

6.4.0.4 Random-effects meta-analysis of splines, sensitivity to parameters

6.5 WLZ, stratified by maternal BMI

6.5.0.1 Primary plots

```
## Warning: Removed 9963 rows containing missing values (geom_path).
```

6.5.0.2 Splines fit to all data, naive to study membership

6.5.0.3 Splines fit to random-effect pooled monthly means

6.5.0.4 Random-effects meta-analysis of splines, sensitivity to parameters

6.6 LAZ, stratified by maternal BMI

6.6.0.1 Primary plots

6.6.0.2 Splines fit to all data, naive to study membership

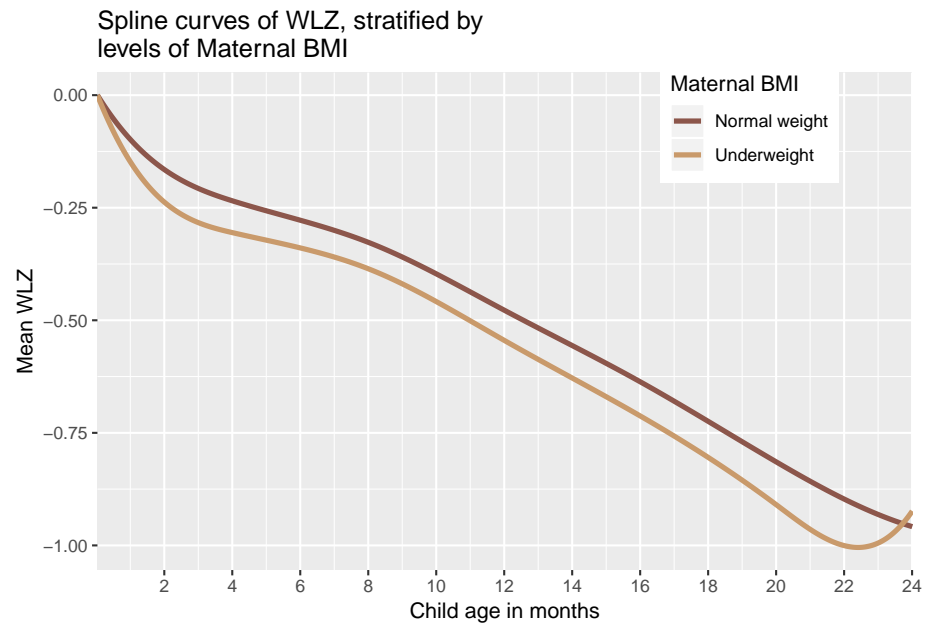

```
## Warning: Removed 195133 rows containing non-finite values (stat_smooth).
```

6.6.0.3 Splines fit to random-effect pooled monthly means

6.6.0.4 Random-effects meta-analysis of splines, sensitivity to parameters

Chapter 7

Dropping PROBIT Trial

The PROBIT randomized control trial, conducted in Belarus, is the only study from Europe included in the manuscript “Causes and consequences of child growth faltering in low resource settings”. While Belarus was a middle-income country during the 1990’s the environmental and nutritional conditions, as well as infectious diseases patterns, are different from other included studies from South Asia, Africa, and Latin America, and prevalence of stunting and wasting was far lower. Here, we examine random-effects pooled attributable differences in LAZ and WLZ at 24 months (the analysis presented in Figure 2 of the primary manuscript), calculated with and without estimates from the PROBIT trial. Only exposures measured in the PROBIT trial are included. While point estimates and rank ordering of risk factors vary slightly after excluding PROBIT, the changes are not consequential.

Chapter 8

Heatmaps

8.1 Heatmap of significance of estimates, region stratified

8.1. HEATMAP OF SIGNIFICANCE OF ESTIMATES, REGION STRATIFIED47

8.2 Heatmap of significance of estimates pooled using fixed effects

8.2. HEATMAP OF SIGNIFICANCE OF ESTIMATES POOLED USING FIXED EFFECTS49

8.3 Heatmap of significance of estimate, unadjusted

Chapter 9

KI Kaplan-Meier Survival Curves

9.1 Associations between early growth failure and mortality

9.1.1 Random Effects Pooling

9.1. ASSOCIATIONS BETWEEN EARLY GROWTH FAILURE AND MORTALITY53

9.1.2 Fixed Effects Pooling

9.2 Associations between any growth failure and mortality

9.2.1 Random Effects Pooling

9.2.2 Fixed Effects Pooling

9.3 Kaplan-Meier curves

9.3.1 Wasting under 6mo

9.3.2 Severe wasting under 6mo

9.3.3 Persistent wasting under 6mo

9.3.4 Stunting under 6mo

9.3.5 Severe stunting under 6mo

9.3.6 Wasted and stunted under 6mo

9.3.7 Underweight under 6mo

9.3.8 Severe underweight under 6mo

Chapter 10

Forest plots of relative risk

** [TEMP] Will fill in with all primary forest plots - right now just printing one for space/speed of publishing **
